Title: Array Operations

Aim:

To perform matrix addition, multiplication, transpose, determinant and inverse using NumPy.

Algorithm:

1. Start.
2. Import NumPy.
3. Create two square matrices A and B.
4. Compute A + B, and A x B using `np.dot()` or `@`.
5. Compute the transpose using `A.T`.
6. Compute the determinant using `np.linalg.det(A)`.
7. Compute the inverse using `np.linalg.inv(A)` if the determinant is non-zero.
8. Display the results.
9. Stop.

Program:
