2.DATA SPLITTING PROGRAM

Aim

To write a program to split the given dataset into training and testing sets, so that a model can be
trained on one part of the data and evaluated on unseen data.

Algorithm

1. Start the program.
2. Import the required libraries (pandas and train_test_split from sklearn.model_selection).
3. Load the dataset from the input file.
4. Separate the data into input features (X) and the target variable (y).
5. Choose the split ratio, for example 80% for training and 20% for testing.
6. Split the data into training and testing sets using train_test_split, with a fixed random_state so the split can be repeated.
7. Display the number of records in the training set and the testing set.
8. Display the training and testing data.
9. Stop the program.

Program&Result:
